DESCRIPTORS: *Diabetes, *Lipids, Drugs, *Orinase.
Blood chemistry, Fatty acids, *Metabolism.

In 14 diabetics the behavior was studied of the blood fats following treatment with tolbutamide. The lipid fractions profoundly altered by the disease, tend to become distinctly normalized provided that the diabetic picture responds favorably to therapy. In particular, it was noted that an increase in the phosphatides occurred, along with a reduction of the total lipids, elevated glycerides, and especially of fraction A of the steroids (Biological Sciences--Pharmacology, TT, v. 9, no. 3)
